

Dynamics of a Single Rigid Body

CS 6301 Special Topics: Introduction to Robot Manipulation and Navigation

Professor Yu Xiang

The University of Texas at Dallas

Robot Dynamics

- Study motion of robots with the forces and torques that cause them
 - Newton's second law $F = ma$
- Forward dynamics
 - Given robot state $(\theta, \dot{\theta})$ and the joint forces and torques \mathcal{T} Simulation
 - Determine the robot's acceleration $\ddot{\theta}$
- Inverse dynamics
 - Given robot state $(\theta, \dot{\theta})$ and a desired acceleration $\ddot{\theta}$ (from motion planning)
 - Find the joint forces and torques \mathcal{T} Control

Grid Methods with Motion Constraints

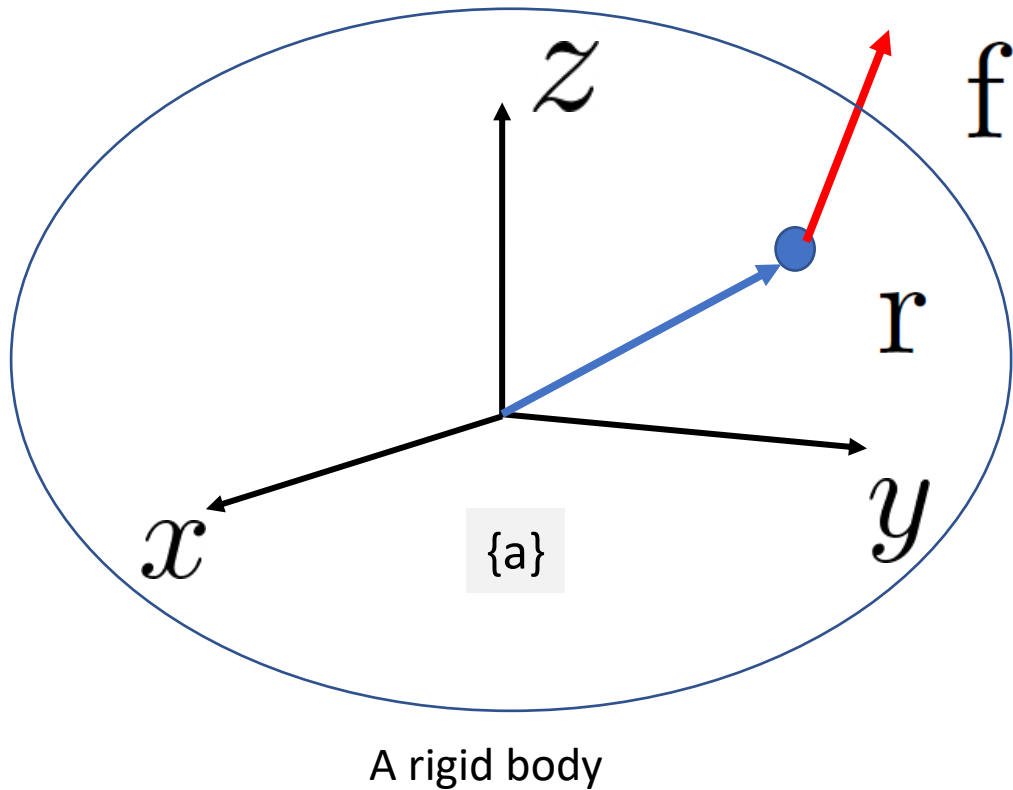

Algorithm 10.2 Grid-based Dijkstra planner for a wheeled mobile robot.

```
1: OPEN  $\leftarrow \{q_{\text{start}}\}$ 
2: past_cost[ $q_{\text{start}}$ ]  $\leftarrow 0$ 
3: counter  $\leftarrow 1$ 
4: while OPEN is not empty and counter < MAXCOUNT do
5:   current  $\leftarrow$  first node in OPEN, remove from OPEN
6:   if current is in the goal set then
7:     return SUCCESS and the path to current
8:   end if
9:   if current is not in a previously occupied C-space grid cell then
10:    mark grid cell occupied
11:    counter  $\leftarrow$  counter + 1
12:    for each control in the discrete control set do
13:      integrate control forward a short time  $\Delta t$  from current to  $q_{\text{new}}$ 
14:      if the path to  $q_{\text{new}}$  is collision-free then
15:        compute cost of the path to  $q_{\text{new}}$ 
16:        place  $q_{\text{new}}$  in OPEN, sorted by cost
17:        parent[ $q_{\text{new}}$ ]  $\leftarrow$  current
18:      end if
19:    end for
20:   end if
21: end while
22: return FAILURE
```

Reversals are penalized

Torque

Point $r_a \in \mathbb{R}^3$

Force $f_a \in \mathbb{R}^3$

Torque or Moment

$m_a \in \mathbb{R}^3$

$$m_a = r_a \times f_a$$

Spatial Force or Wrench

- Merge moment and force in frame {a}

$$\text{Wrench } \mathcal{F}_a = \begin{bmatrix} m_a \\ f_a \end{bmatrix} \in \mathbb{R}^6$$

- If more than one wrenches act on a rigid body, the total wrench is the vector sum of the wrenches
- Pure moment: a wrench with a zero linear component

Dynamics of a Single Rigid Body

- A rigid body with a set of point masses
- Total mass $\mathbf{m} = \sum_i \mathbf{m}_i$
- The origin of the body frame

Center of mass $\sum_i \mathbf{m}_i \mathbf{r}_i = 0$

- If some other point is chosen as origin, move the origin to $(1/\mathbf{m}) \sum_i \mathbf{m}_i \mathbf{r}_i$

Dynamics of a Single Rigid Body

- Assume the body is moving with a body twist $\mathcal{V}_b = (\omega_b, v_b)$
- $p_i(t)$ be the time-varying position of m_i , initially at r_i

$$\dot{p}_i = v_b + \omega_b \times p_i$$

$$\begin{aligned}\ddot{p}_i &= \dot{v}_b + \frac{d}{dt}\omega_b \times p_i + \omega_b \times \frac{d}{dt}p_i \\ &= \dot{v}_b + \dot{\omega}_b \times p_i + \omega_b \times (v_b + \omega_b \times p_i)\end{aligned}$$

$$\ddot{p}_i = \dot{v}_b + [\dot{\omega}_b]r_i + [\omega_b]v_b + [\omega_b]^2 r_i$$

Dynamics of a Single Rigid Body

- For a point mass $f_i = m_i \ddot{p}_i$

$$f_i = m_i (\dot{v}_b + [\dot{\omega}_b] r_i + [\omega_b] v_b + [\omega_b]^2 r_i)$$

- Moment of the point mass $m_i = [r_i] f_i$
- Total force and moment on the body

$$\text{Wrench } \mathcal{F}_b = \begin{bmatrix} m_b \\ f_b \end{bmatrix} = \begin{bmatrix} \sum_i m_i \\ \sum_i f_i \end{bmatrix}$$

Dynamics of a Single Rigid Body

- Linear dynamics

$$\begin{aligned}
 f_b &= \sum_i m_i (\dot{v}_b + [\dot{\omega}_b] r_i + [\omega_b] v_b + [\omega_b]^2 r_i) \\
 &= \sum_i m_i (\dot{v}_b + [\omega_b] v_b) - \sum_i m_i [r_i] \dot{\omega}_b + \sum_i m_i [r_i] [\omega_b] \omega_b \\
 &= \sum_i m_i (\dot{v}_b + [\omega_b] v_b) \\
 &= m (\dot{v}_b + [\omega_b] v_b).
 \end{aligned}$$

$$[x] = \begin{bmatrix} 0 & -x_3 & x_2 \\ x_3 & 0 & -x_1 \\ -x_2 & x_1 & 0 \end{bmatrix}$$

$$\sum_i m_i [r_i] = 0$$

Dynamics of a Single Rigid Body

$$[a] = -[a]^T$$

$$[a]b = -[b]a$$

$$[a][b] = ([b][a])^T$$

- Rotational dynamics

$$\begin{aligned}
 m_b &= \sum_i m_i [r_i] (\dot{v}_b + [\dot{\omega}_b] r_i + [\omega_b] v_b + [\omega_b]^2 r_i) \\
 &= \sum_i m_i [r_i] \dot{v}_b + \sum_i m_i [r_i] [\omega_b] v_b \\
 &\quad + \sum_i m_i [r_i] ([\dot{\omega}_b] r_i + [\omega_b]^2 r_i) \\
 &= \sum_i m_i (-[r_i]^2 \dot{\omega}_b - [r_i] [\omega_b] [r_i] \omega_b) \\
 &= \sum_i m_i (-[r_i]^2 \dot{\omega}_b - [\omega_b] [r_i]^2 \omega_b) \\
 &= \left(-\sum_i m_i [r_i]^2 \right) \dot{\omega}_b + [\omega_b] \left(-\sum_i m_i [r_i]^2 \right) \omega_b \\
 &= \mathcal{I}_b \dot{\omega}_b + [\omega_b] \mathcal{I}_b \omega_b,
 \end{aligned}$$

Fact $[r_i \times \omega_b] = [r_i][\omega_b] - [\omega_b][r_i]$

Body's rotational inertia matrix

$$\mathcal{I}_b = -\sum_i m_i [r_i]^2 \in \mathbb{R}^{3 \times 3}$$

symmetric and positive definite

Euler's equation for a rotating rigid body

Dynamics of a Single Rigid Body

- Linear dynamics

Body twist $\mathcal{V}_b = (\omega_b, v_b)$

$$f_b = \mathbf{m}(\dot{v}_b + [\omega_b]v_b)$$

- Rotational dynamics

$$m_b = \mathcal{I}_b \dot{\omega}_b + [\omega_b] \mathcal{I}_b \omega_b$$

- Rotational kinetic energy

$$\mathcal{K} = \frac{1}{2} \omega_b^T \mathcal{I}_b \omega_b$$

Dynamics of a Single Rigid Body

- Rotational inertia matrix $\mathcal{I}_b = - \sum_i \mathbf{m}_i [r_i]^2 \in \mathbb{R}^{3 \times 3}$

$$\mathcal{I}_b = \begin{bmatrix} \sum \mathbf{m}_i (y_i^2 + z_i^2) & - \sum \mathbf{m}_i x_i y_i & - \sum \mathbf{m}_i x_i z_i \\ - \sum \mathbf{m}_i x_i y_i & \sum \mathbf{m}_i (x_i^2 + z_i^2) & - \sum \mathbf{m}_i y_i z_i \\ - \sum \mathbf{m}_i x_i z_i & - \sum \mathbf{m}_i y_i z_i & \sum \mathbf{m}_i (x_i^2 + y_i^2) \end{bmatrix}$$

$$= \begin{bmatrix} \mathcal{I}_{xx} & \mathcal{I}_{xy} & \mathcal{I}_{xz} \\ \mathcal{I}_{xy} & \mathcal{I}_{yy} & \mathcal{I}_{yz} \\ \mathcal{I}_{xz} & \mathcal{I}_{yz} & \mathcal{I}_{zz} \end{bmatrix}.$$

$$\begin{aligned} \mathcal{I}_{xx} &= \int_{\mathcal{B}} (y^2 + z^2) \rho(x,y,z) dV & \mathcal{I}_{xy} &= - \int_{\mathcal{B}} xy \rho(x,y,z) dV \\ \mathcal{I}_{yy} &= \int_{\mathcal{B}} (x^2 + z^2) \rho(x,y,z) dV & \mathcal{I}_{xz} &= - \int_{\mathcal{B}} xz \rho(x,y,z) dV \\ \mathcal{I}_{zz} &= \int_{\mathcal{B}} (x^2 + y^2) \rho(x,y,z) dV & \mathcal{I}_{yz} &= - \int_{\mathcal{B}} yz \rho(x,y,z) dV. \end{aligned}$$

mass density function $\rho(x,y,z)$

Inertia Matrix

- Principal axes of inertia: eigenvectors of \mathcal{I}_b
 - Directions given by eigenvectors
 - Eigenvalues are principal moments of inertia

Inertia Matrix

- General rotation dynamics

$$m_b = \mathcal{I}_b \dot{\omega}_b + [\omega_b] \mathcal{I}_b \omega_b$$

- If the principal axes are aligned with the axes of {b}, \mathcal{I}_b is a diagonal matrix

rotational dynamics

$$m_b = \begin{bmatrix} \mathcal{I}_{xx} \dot{\omega}_x + (\mathcal{I}_{zz} - \mathcal{I}_{yy}) \omega_y \omega_z \\ \mathcal{I}_{yy} \dot{\omega}_y + (\mathcal{I}_{xx} - \mathcal{I}_{zz}) \omega_x \omega_z \\ \mathcal{I}_{zz} \dot{\omega}_z + (\mathcal{I}_{yy} - \mathcal{I}_{xx}) \omega_x \omega_y \end{bmatrix} \quad \omega_b = (\omega_x, \omega_y, \omega_z)$$

Inertia Matrix

rectangular parallelepiped:

volume = abc ,

$$\mathcal{I}_{xx} = m(w^2 + h^2)/12,$$

$$\mathcal{I}_{yy} = m(l^2 + h^2)/12,$$

$$\mathcal{I}_{zz} = m(l^2 + w^2)/12$$

circular cylinder:

volume = $\pi r^2 h$,

$$\mathcal{I}_{xx} = m(3r^2 + h^2)/12,$$

$$\mathcal{I}_{yy} = m(3r^2 + h^2)/12,$$

$$\mathcal{I}_{zz} = mr^2/2$$

ellipsoid:

volume = $4\pi abc/3$,

$$\mathcal{I}_{xx} = m(b^2 + c^2)/5,$$

$$\mathcal{I}_{yy} = m(a^2 + c^2)/5,$$

$$\mathcal{I}_{zz} = m(a^2 + b^2)/5$$

$$\mathcal{I}_{xx} = \int_B (y^2 + z^2)\rho(x, y, z) dV$$

$$\mathcal{I}_{yy} = \int_B (x^2 + z^2)\rho(x, y, z) dV$$

$$\mathcal{I}_{zz} = \int_B (x^2 + y^2)\rho(x, y, z) dV$$

Inertia Matrix

- Inertia matrix in a rotated frame {c}
- Kinetic energy is the same in different frame

$$\begin{aligned}\frac{1}{2}\omega_c^T \mathcal{I}_c \omega_c &= \frac{1}{2}\omega_b^T \mathcal{I}_b \omega_b \\ &= \frac{1}{2}(R_{bc}\omega_c)^T \mathcal{I}_b (R_{bc}\omega_c) \\ &= \frac{1}{2}\omega_c^T (R_{bc}^T \mathcal{I}_b R_{bc}) \omega_c.\end{aligned}$$

$$\mathcal{I}_c = R_{bc}^T \mathcal{I}_b R_{bc}$$

Steiner's theorem

- The inertia matrix \mathcal{I}_q about a frame aligned with $\{b\}$, but at a point in $\{b\}$ $q = (q_x, q_y, q_z)$, is related to the inertia matrix calculated at the center of mass by

$$\mathcal{I}_q = \mathcal{I}_b + \mathbf{m}(q^T q I - q q^T)$$

- Parallel-axis theorem: the scalar inertia \mathcal{I}_d about an axis parallel to, but a distance d from, an axis through the center of mass is

$$\mathcal{I}_d = \mathcal{I}_{\text{cm}} + \mathbf{m}d^2$$

Inertia Matrix

- Change of reference frame

$$\mathcal{I}_c = R_{bc}^T \mathcal{I}_b R_{bc}$$

$$\mathcal{I}_q = \mathcal{I}_b + \mathbf{m}(q^T q I - q q^T)$$
