

Voice-Controlled Robotic Manipulation

Dhairya Patel
Harsh Patel
Riyank Makwana

Problem Statement

- Communication gap between humans and robots
- Complexity in translating natural language to robot actions
- Limited real-time interaction capabilities
- Requirement for extensive technical knowledge to operate robots

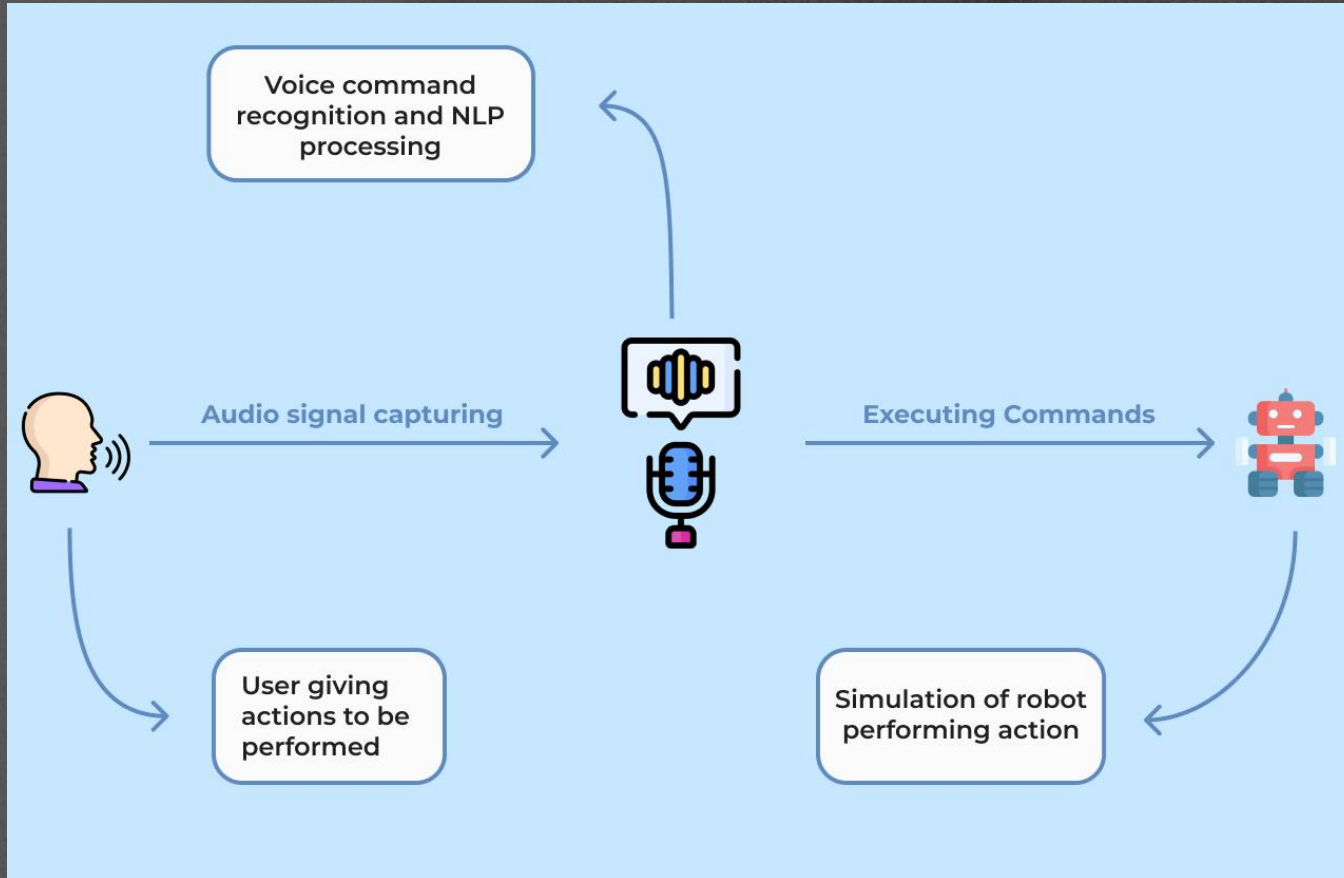

Introduction

- Bridging human-robot communication through natural language
- Integration of cutting-edge technologies
 - Natural Language Processing
 - Advanced Robotic Control
 - Dynamic Simulation
- Focus on intuitive and effective interaction

System Overview

- Voice Command Recognition System
- Natural Language Processing Engine
- Robotic Navigation & Manipulation
- PyBullet Simulation Environment

Tools & Libraries

- NLP
 - SpeechRecognition
 - PyAudio
 - NLTK
- Robotics
 - PyBullet
 - PyBullet_Data
 - Pyb_utils
 - GraspTrajOpt

Robot Model: - Fetch

Voice Command Processing

- Integration with Google's Web Speech API
 - Background noise minimization
 - Real-time audio processing capabilities
 - Conversion of speech to text for NLP processing
-

Natural Language Processing

- NLTK-based language processing
- Segmentation of commands into actionable instructions
- Command validation and error handling

Robot Navigation Control

- Forward/backward motion control
- Left/right movement capabilities
- Rotation and orientation control

Demo

Object Manipulation

- Object & Collision detection
- Grasp position and orientation calculation
- Approach trajectory planning
- Grasping motion control

Real World Applications

- Assistive Robotics
- Education and Research
- Healthcare
- Entertainment & Hospitality

Future Work

- Advanced AI and NLP
- Enhanced Collision Avoidance
- Improved Mobility

Thank you!
